# AdventNet SNMP API - Free Edition Free [32|64bit] (April-2022)

The SNMP API is a comprehensive Java SNMP library which supports all the SNMP versions - SNMPv1, SNMPv2c and SNMPv3. It supports GET, GETNEXT, GETBULK, SET, SMT and much more. It also provides an elegant way of implementing the security and access controls. Users can define and implement their own security and access control model. AdventNet SNMP API has the provision to store the v3 configuration data in a database. AdventNet SNMP API completely supports SNMPv3, as it is compliant with RFC 3411, 3412, 3413, 3414, and 3415. AdventNet SNMP API provides an elegant way of implementing the security and access controls. Users can also define and implement their own security and access control model. SNMP API can be used with two-tier as well as three-

tier architecture. Here, in two-tier architecture, the management applications directly communicate with the agents. In the three-tier architecture, the management applications communicate with the agents through a manager-server. For building highly scalable management applications, three-tier architecture is the best option. SNMP API can be used with two-tier as well as three-tier architecture. In the two-tier architecture, the management applications directly communicate with the agents. Here, in two-tier architecture, the management applications directly communicate with the agents. The management application can receive SNMP traps from the agent, which can be processed based on predefined criteria for effective SNMP management. AdventNet SNMP API provides complete support for SNMPv1, SNMPv2c and SNMPv3. AdventNet SNMP API can be used with any vendor's SNMP software.

AdventNet SNMP API is available for Windows, Linux, Mac OSX, and Solaris. Key Features: ⦁ Complete support for SNMPv1, SNMPv2c, and SNMPv3. ⦁ Supports SNMPv1, SNMPv2c, and SNMPv3. ⦁ Support SNMP V1/V2c/V3 traps and applications. ⦁ Co-existence and Notification filtering: Supports co-existence and notification filtering. ⦁ Proxy forwarding: Supports proxy forwarding. ⦁ SNMP with LM authentication: Supports lm authentication. ⦁ Defines a

Developed by 5nines, AdventNet SNMP API consists of high-level SNMP management tools to make life easy for the network managers who want to have an SNMP agent as part of their management tool. It is a full suite of SNMP components (refer to your specific SNMP stack requirements), which consist of the following: ⏹ Java SNMP Library: This provides a comprehensive set of Java components that enable developers to build powerful and reliable SNMP applications. ⏹ SNMP API: SNMP API is a set of Java APIs which provide a high level interface to the SNMP stack. These APIs are built to provide a common interface to the SNMP stack, which is useful when you want to build your own SNMP management tool. ⏹ In-built Web Server: This tool is a standalone HTTP server that can be used to expose

SNMP API for the users. You can easily use it as a standalone tool, or simply integrate it into a web-based application, or even a SOA application. ⬜ Web Management Interface: This tool allows you to manage the SNMP devices using a simple HTML based Web interface. It is a powerful tool for remote monitoring and management of SNMP devices from anywhere. ⬜ SNMP Client Agent: This is a tool that allows you to send SNMP SET, GET, GETNEXT, TRAP and other commands to SNMP devices. It has the facility to authenticate to SNMP devices using any of the supported authentication mechanisms such as SNMPv1, SNMPv2c or SNMPv3. ⬜ SNMP Provisioning Agent: This agent takes care of creating the SNMP devices for you. It also takes care of creating the Default MIB Definitions as well as the authentication keys (credentials) if required. It can also load new MIB definitions into the device if

required. ⬜ SNMP Client Agent: This tool is used to interact with the SNMP devices from your own code. It can be used to send SNMP SET, GET, GETNEXT, TRAP and other commands. The tool can also be used to retrieve the values from the SNMP devices. ⬜ SNMP Access Policy Agent: This tool allows you to define a set of rules for access control and access authorization to SNMP devices. ⬜ SNMP Customization: This tool allows you to easily customize the SNMP packages and MIB

What's New in the?

AdventNet SNMP API is the best way to integrate with the management systems and enhance the performance of the applications. As the SNMP API supports SNMP v1, SNMP v2c and SNMP v3, it provides a robust platform for building high-performance network management applications. Why Using

AdventNet SNMP API in your next project will save you time and make your job easier. You can build your next application fast with our pre-packaged features and components. Here are some of the most common reasons why you should use AdventNet SNMP API: ⏹ Support for SNMP v1, SNMP v2c, and SNMP v3. ⏹ 100% Java Based API: 100% Java based API make it easier for you to deploy and manage the application. ⏹ Powerful SNMP library: With our library, you can simply and quickly write your own application for monitoring and management of devices and nodes. ⏹ Fast and easy to use API: Our developer focused API provide a very simple and easy to use API. ⏹ Independent: The APIs are independent of your management applications. So, you can use this library with other management application. AdventNet SNMP API Features: ⏹ Multi-lingual support: Complete support for SNMP v1, SNMP

v2c and SNMP v3. ⍰ SNMPv3 security: Support for HMAC-SHA-96, HMAC-MD5-96, CBC-DES and 128 bit AES encryption. ⍰ Robust SMIv1 and SMIv2 MIB Parser: Seamlessly parses the MIB definitions from any OEM vendor. Offers various flavors of parsing based on the MIB definitions. ⍰ MIB Loading: Option to load MIB definitions from a pre-compiled file, a Serialized file, or a Database to boost the performance. ⍰ IPv6 (Internet Protocol Version 6) support: Provides connectivity with IPv6 and IPv4 based devices. ⍰ SNMP Broadcasting: Broadcasts snmp packets across the network to auto-discover snmp devices in the network. ⍰ SNMP Beans: Provides high-level bean components such as, SnmpTarget, SnmpTable, SnmpPoller, TrapReceiver for easy application development. ⍰ Database support: Provides scalability by storing MIB definitions and SNMPv3 configuration data in any relational

database such as, MySQL and Oracle. ⸮ MIB Browser: Tool for administering network and system components. Can be run as a stand-alone application or invoked from a web browser. ⸮ Command

System Requirements:

Minimum: OS: Windows 10, 7, 8 or a version of Windows that is no more than 8.1 and which can be updated to version 10. Windows 10, 7, 8 or a version of Windows that is no more than 8.1 and which can be updated to version 10. Processor: 1 GHz processor or faster 1 GHz processor or faster Memory: 2 GB RAM 2 GB RAM Graphics: Microsoft DirectX 9.0c compatible, Pixel Shader 3.0 compatible and WDDM 2.0 compatible
