Exhibition, solutions of collection groups that. Array of written solutions.Q: How to deploy application in a network I am developing an application in java using wicket framework. Now I need to deploy my application in a network. Is there any free solution for that? A: You can use Nozi servers. And of course you can do this with your own Jetty server - see this for more information. See also this article: the Wicket framework is a web framework for Java. Wicket describes itself as a web framework (without fuss). It is in a way analogous to YUI, but instead of providing a plugin architecture, it allows you to use components to build your pages. Q: How can I query a value in a collection, which is in another collection? What is the best way to write a query that involves a value in a collection, which is in another collection? Let me give an example. Consider a collection of user accounts, each of which has a collection of comments made on that account. Let's say I'm writing a search method to find a particular user account based on

a search query (let's call the method `findAccountByUserName`), and one of the things I want to do is to find a user account based on the comments made on that account. I'm trying to avoid having to query the two collection separately, perhaps by transforming the two sets into a new collection. My current query approach looks like: `from userAccounts in context.userAccounts from comments in userAccounts.comments where comments.user`
