To the surprise of most of the nurses who administered them, the babies in the placebo group slept less well. The mothers of the melatonin-treated infants actually increased their daytime naps by 15 minutes a day and cut back their nighttime naps by an average of 2 hours a day. In a second study, infants born prematurely at less than 32 weeks gestation to 38 mothers were placed on melatonin therapy. The outcome was similar. The researchers suggest that the brain's circadian rhythm, which coordinates sleep and wake cycles, may be disturbed by exposure to light during nighttime at the time of birth. The light drives the biological clock on the same axis, but opposite to the way it regulates the menstrual cycle in humans and other species. The brightness of light delivered to the eye during the first weeks of life is thought to be the primary factor in the failure of infants to sleep. Melatonin is naturally present in most mammals. It functions as a nighttime hormone, before the body is ready to sleep c6a93da74d
